## ABOUT THE COURSE

# Course Overview

A project is any planned undertaking whose end product must be defined in terms of anticipated profit and which involves control of three essential elements: cost, time, and quality. In the Oil and Gas business, the effectiveness of Project Management is highly important and very visible.

Marine Project Managers must have special knowledge of the unique requirements and style of the maritime industry. The definition of the project is the key to overall success, and the level of detail in defining project objectives, policies, priorities, organization, and procedures should receive focused attention.

This course gives you the foundation, techniques, and tools to manage each stage of the project life cycle, work within organizational and cost constraints, set goals tied directly to stakeholder needs, and utilize state-of-the-art project management tools to get the work done on time and within budget.

Covering the entire project life cycle, this course is built around best practices currently used in today's fast-paced business environment. Case studies on both offshore and onshore operations will be used to enhance understanding and allow practical application of the course content.

### WHO SHOULD ATTEND

Marine Managers and Section Heads involved in project management within the maritime and offshore industry.
